

LET'S PLAY

NINJA LEAGUE

MASTER IN AI E AGENTI AI PER IL BUSINESS

JAVASCRIPT PROJECT

FILIPPO LA GRECA

PROJECT OVERVIEW

Ninja League is a **web application** built with **HTML, CSS and JavaScript**. The project transforms a simple **counter application** into a small **role-playing experience** where users progress through **ninja ranks** while representing an **Italian soccer team**. The application dynamically updates the interface based on the selected team and the player's level.

PROJECT GOALS

The main goals of the project were:

- Create a **fully functional counter application**
 - Practice **JavaScript DOM Manipulation**
 - Manage application state dynamically
 - Use **Session Storage** to persist data
 - Develop a **responsive user interface**
- Apply **gamification concepts** to improve user engagement

NINJA LEAGUE ARCHITECTURE

JAVASCRIPT CONCEPTS

Ninja League uses a **state-driven architecture** where every user action automatically updates the interface. Core concepts implemented:

- **DOM Manipulation:** Dynamic creation and update of UI elements.
- **Event Handling:** User interactions trigger real-time updates.
- **State Management:** Levels, ranks, and teams in a centralized state object.
- **Dynamic Rendering:** Characters, backgrounds, colors, and messages change according to progression.
- **Session Storage:** User progress is preserved during the browser session.

MAIN FEATURES

The application revolves around a **progression system**. Each click on the "+" button represents training and increases the **player's level**. As the level increases:

- The ninja gains **experience**
- The **rank changes**
- The **character appearance** evolves
- **Promotion messages** are displayed

NINJA SYSTEM

To create a sense of progression and achievement, Ninja League includes a **five-level ninja ranking system**. Players start as a Student and advance through increasingly prestigious ranks as they gain levels: **Student → Genin → Chunin → Jonin → Kage**

Each promotion rewards the player with:

- A **new ninja appearance**
- A **new rank title**
- A **promotion notification**

TEAM SYSTEM

Players can choose between **three soccer teams**:

  Roma

 Napoli

  Juventus

Each team provides a **unique experience** by changing the application's **visual identity**, including **custom backgrounds, themed ninja characters, team colors, and personalized promotion messages**. To maintain the feeling of starting a new adventure, selecting a different team resets the current progress and begins a brand-new ninja journey.

ROMA TEAM SELECTION (example)

From Student level

To Genin level

RESPONSIVE DESIGN

The application was designed to **work on multiple screen sizes.**

Desktop:

- Large background images
- Character displayed outside the card
- Expanded layout

Mobile:

- Compact interface
- Responsive controls
- Optimized character positioning

RESPONSIVE DESIGN (example)

From Desktop level

To Mobile level

FINAL RESULTS

Ninja League demonstrates how even a simple application can become engaging when **user experience** is placed at the center of the design. Through **progression mechanics, team identity, dynamic visuals, and responsive design**, the project transforms a basic counter into a **small interactive adventure**.

This project highlights both technical JavaScript skills and the ability to design experiences that are more meaningful, rewarding, and enjoyable for users.
